

SLIME!

Make your own slime and learn about polymers. Grades 2-6

INGREDIENTS

- 1/2 cup white glue
- 1/2 teaspoon baking soda
- a few drops of food colouring and glitter (optional)
- 1 tablespoon contact lens solution

SCIENCE!

Polymers are formed when chemical reactions take place between substances to form a new substance.

INSTRUCTIONS

- 01** In a glass or plastic bowl, mix white glue and baking soda
- 02** Add 1 or 2 drops of food colouring and some glitter. This step is optional and is included to make the slime colourful. Mix well.
- 03** Add contact lens solution. This is the active ingredient to make the polymer. Mix well.
- 04** If the mixture is too thin, add an additional teaspoon of contact solution and stir well. Repeat this step once or twice until it thickens into slime. The slime is ready when it starts to stick to itself and not to the bowl. At this time, it can be picked up and kneaded.

Enjoy your slime!
